AutoCAD is part of the Autodesk 3D design, architecture, manufacturing, and construction solutions. AutoCAD Features AutoCAD is a major CAD application that provides many functions, including DWG and PDF file creation, data collection and editing, annotation, and visualization of 3D, 2D, and vector data. The following list highlights some of the key features of AutoCAD. Accessing AutoCAD can be done through the AutoCAD Application Programming Interface (API). The AutoCAD API supports interapplication communication, and the AutoCAD command interpreter runs as a thread in AutoCAD. As the application continues to run, the API notifies the main program when new data is available. Interface The interface for AutoCAD includes toolbars, windows, menus, palettes, and dialog boxes. Toolbars consist of buttons or pull-down menus. Toolbars can be custom built by dragging components to form them. The main AutoCAD toolbar includes the basic and advanced options. The basic toolbar contains commands that are useful in most applications. The advanced toolbar includes more complex commands for creating more sophisticated drawings. Windows are the boxes in which AutoCAD displays commands, toolbars, palettes, the drawing area, and data sets. A window can contain a drawing area or a database. Each window can be docked or undocked. A window can also have dialog boxes. In the AutoCAD 2016 graphical user interface (GUI), many windows, toolbars, and palettes are available to a user at any time. Palettes AutoCAD includes many palettes. Palettes are collections of commands, property pages, and dialog boxes. Palettes can be built using any of the commands listed below.

- Create Palette/Load Palette: Builds a palette from an external or AutoCAD command file.
- Organize Palette: Builds a palette from the DesignCenter palette.
- Script Palette: Builds a palette from a script file.
- New Palette: Builds a palette from a palette file.
- Browser Palette: Builds a palette from a directory of files.
- New Layer Palette: Builds a palette from a directory of layers.
- New Document Palette: Builds a palette from a directory of drawings.
- Revisions Palette: Builds

Add-ons for AutoCAD create functionality for editing, analysis, coordination, dimensioning and drafting. Existing functionality is extended by the use of AutoLISP to control AutoCAD's application logic, by Visual LISP to extend the functionality of the Draw and Publish tools, and VBA to implement the functionality of its Ribbon, Dynamic Input Panel and sheet-based UI. The current release of AutoCAD includes new command functions created for a new style of CAD program that allows users to produce the same drawing from many different viewpoints. So far I have a snake game written in Processing. I have created a snake body, a head and a tail. I also have the snake move, make a sound and a draw function which renders the whole screen. The snake moves at a constant speed of 10 pixels/time step and I want it to move on a continuous basis. So what I was thinking is to have a Boolean value that is set to false when the snake is at the end of the screen and change it to true when it reaches the beginning of the screen, then I can draw the whole screen. But I'm not really sure how to go about this. My current code is shown below class Snake{ float positionX, positionY, directionX, directionY; float speed = 10; boolean dead; boolean alive; boolean heading; boolean eaten; boolean head; boolean tail; void setup(){ size(600,600); background(0); frameRate(10); positionX = width / 2; positionY = height / 2; directionX = 0; directionY = 0; head = false; tail = false; head.move(); head.makeSound(); head.show(); head.draw(); positionX = width - (head.width + 15); positionY = height / 2; directionX = 0; directionY = 1; tail.move(); tail.makeSound(); tail.show(); tail.draw(); positionX = width / 2; positionY = height - (tail.width + 15);
