Open Autocad. Click on 'New' in the File menu and select 'Autocad Model'. Select 'Autocad Model'. Select the area on the map where you want to generate your model. Autodesk AutoCAD uses a system called the zone system. The zone system is a way of representing the area of an object on a map. Each object has a set of coordinates and a 'zone' number that determines the area on the map it is represented on. The system can be a bit complicated to work with but it has many uses. I'd say that using the zone system is the most used way of putting things into a map. There are several ways you can use the zone system. A popular way is to use the offset method. In this case, you start by picking an area on the map that represents the area of your object. Now click on the origin on the map (the first square in the top left). Now drag your mouse to where you want to place your object. The coordinates of the object will be in relation to the origin. If you want to make your object rotate, click on one of the squares. To change the rotation point, click on a different square. Q: Why does my game sometimes crash when loading a saved game? My game sometimes crashes when loading a saved game. This doesn't happen every time I load a saved game, just some of the time. How can I solve this problem? A: This has happened to me too. A workaround is to move your save file to a folder that is not your Documents folder. I have found that it rarely causes problems to copy it to the main Windows folder, but it occasionally will crash if you try to copy it to the 'My Documents' folder. You may be able to get it working again by copying the save file to a different folder, then uninstalling it. Then re-install it from a different folder. A: Another cause could be that you change the orientation of your PC, and for some reason the save file has been saved with the orientation set in a particular direction. So for example, you're editing your map with the orientation set to landscape, but instead of saving it, you close the program and reopen it, and your map is now saved with the orientation set to portrait, but you don't have any other
