Then, $\mathcal{M}_g(C)$ is a smooth projective variety and its general point parameterizes a smooth curve with C as a fiber. More generally, we can consider S -fold cover of C and its (stack) quotient by \mathcal{M}_g . Also, by an argument due to Kontsevich, if $g+1 \leq \mathcal{M}_g$ is a fine moduli space of curves; furthermore, if $g \geq 3$ then it is a nice variety. What I'm looking for in the above statements, for example for the Kontsevich's result, is a proof that these varieties are even algebraic varieties. Is this true or known? I found the following Mathoverflow question, but I wonder whether there are other references/proofs in the literature. A: A nice book with a complete account of the moduli space of curves is the book with Mumford and Knudsen. In my experience there is hardly a good reference for the moduli space of curves other than that book. It is true that if $g+1 \leq \mathcal{M}_g$ is a fine moduli space of curves, but not algebraic varieties. See this question. Effects of cardioactive pyrenyl ketones on calcium current in pancreatic beta-cells. The effects of cardioactive pyrenyl ketones such as 2-(4'-aminophenyl)ethanone (PEP), 2-(2'-methylphenyl)ethanone (MePPE), 2-(2'-methylphenyl)ethanone-2-sulfonic acid (MePPE-S), 2-(3'-nitrophenyl)

The text between the - becomes garbage like this. I thought it might just be my local machine but I have tried it on others with the same result. Anyone have any ideas?
