VisiÂ .Q: Robot Framework: How to check if a loop terminates I'm using the following code to verify  
certain things. While True: Check that google.com exists Sleep 3000 I am pretty sure it will not verify  
until Google exists. I would like a way to verify in Robot Framework that the While loop will have  
terminated before the execution of the next line. Is there a keyword or something else I can use to  
do this? A: Robot does support the Expect keyword. To accomplish this you would do something like  
this: Expect: \${counter} = Counter \${count} \*\*\* Test Cases \*\*\* Test Some Way \${expected} = Set  
Variable 1 \${counter} = Get Variable \${expected} Check Log Expected is not equal to actual  
(\${counter}!= \${expected}) Sleep 1000 But if you are already using a while loop here you might  
want to take a look at the How To Use Expectations documentation to achieve more complex  
behavior. A: Robot doesn't support this out of the box (that's an advantage actually). It sounds like  
an appropriate situation to solve with loops, but this is less of a language "using" feature and more  
of a looping function. The simplest way to do this would be to use a state variable (var in python)  
(named var in Robot) and have the loop check that state variable. while var == "checking": ... your  
stuff var = "waiting" You can also use the Expected keyword to do this. Delegating device  
administration Goods The DevTest team is currently focusing their attention to the management of  
PXE deployments. We need devices that are ready to be used, from many users and to many users.  
We also need a good way to manage those users and their
