A: Possível amigalhaço Porque ele está muito esperto aprender ou para melhorar seu hábito e você mesmo quem está realizando o trabalho de ensinar. Ainda mais quando o aluno está conectado com a sua vida pessoal. Porque você pode incentivar às vezes esse negócio: "pode ser empreendedor maluco, desenvolver um produto que vai sair pra frente" e talvez o amigalhaço seja parte da motivação de fazer isso. This invention relates to continuous process for the production of nitrile by the reaction of ammonia and carbon monoxide in the presence of a catalyst. U.S. Pat. No. 3,637,848 describes a continuous process for producing nitrile by reacting ammonia and carbon monoxide in the presence of a catalyst comprising a Group VIII metal supported on a carrier such as alumina. When operating such a process in commercial practice, it is necessary to regenerate the catalyst. This involves, inter alia, a reducing (or oxidation) treatment in which the Group VIII metal is reduced or oxidized to the corresponding metal oxide or hydroxide. It is known to carry out the regeneration in two stages, an initial reducing stage being followed by a second step of oxidizing the metal to the corresponding metal oxide. If the reaction is carried out under non-oxidizing conditions, a first product comprising a mixture of the lower valent oxide and nitrides of the metal is formed and this has to be oxidized before the metal oxide/nitride can be reduced to the lower valent oxide. However, one disadvantage of this is that a substantial amount of unreacted ammonia and carbon monoxide is removed from the reaction mixture together with the nitrile product. This ammonia and carbon monoxide is lost as it cannot be re-used as a reactant for the reaction. In Japanese application No. 133,468 of Feb. 2, 1973 (open to public inspection) to Yamada et al, there is described a continuous process for the production of nitrile in which ammonia and carbon monoxide are reacted in the presence of a supported catalyst comprising a Group VIII metal supported on an
