Interscience Publishers £ 868 pages. The transmission of electricity along a line of conductor starts with a line of potential in a free space. In this, an electrical potential difference is created by a generator, or any other electrical source in a free space. It is given by the relation, $V(S) = \int \frac{\rho}{r} ds$. Bending an electrical wire is an ideal practice of transmission line theory. The objectives of bending an electrical wire are mentioned below: To produce a return path for a plane wave by reflecting it at the load. To produce an isolation path for a high-frequency wave. To produce
