It's a really visual art of programming that lets kids start with something they can easily visualize and have them transform it into something much more complex. Before they can even go into the Scratch for Beginners online course, a good foundation is laid by a little app they can play with. My daughter and her friend were really enjoying the LittleBit of Code online course. There's a lot of fun things they could do by clicking and dragging to make a little rectangle grow or shrink. So when we started designing the new course I wanted to put a "robot" in there too. Of course a robot is less about "moving" and more about having fun and creating something in response to different prompts. And when you get right down to it, it's just a bunch of blinking lights on a circuit board. The robot's first task is to scratch an old board to see what the lights are all about. Then, the lights are learning to change state in response to two commands: one of their own and one that you issue to them. The robot can even talk to you, reminding you to do something and telling you when it's ready to move on to the next step. I designed the robot to be able to talk, as this was a really fun thing for them to figure out on their own. On the old course they figured out that you can talk by changing the colors of the lights, but with the new course you really have to think about the lights changing when you click on them. I also wanted to make sure they could talk to you without having to have their computer on, so you can play with this step-by-step together. The final step in the tutorial is to worry about a circuit board. I had my daughter and her friend think about what they did, and they described it in terms of what they could see on the c6a93da74d
