Photoshop offers many features that first time users may not expect. Here are a few examples:

1. Goto reference point: You can easily find a spot, anywhere in your document, that you can place a new reference point. When you place this reference point, the pixels in the image will always match the location you selected.
2. Navigator view: You can move around the image and review how the pixels are displayed. This is not just for recording the pixel setting but can also be used to verify the image resolution.
3. Content-Aware: With this tool you can select an object in your image and allow the pixels around the object to adapt to the new object. For example, if you have two different objects (mountain and desk) you may want to place the mountain on a desk. However, if the pixels around the object change – like a book beside the desk or an arm of the mountain – the desk could actually be appearing on the mountain.
